Issue	Suggestion
Login button should not be present on the login page; it should be register instead of login (bad user experience).	Replace the login button on the login page with a register button to improve user experience.
URL has 'Login' with 'L' in uppercase; it should be lowercase for consistent format and better SEO.	Ensure all URLs use consistent lowercase formatting for better SEO and professionalism.
Clicking the logout button directly logs the user out; there should be a confirmation popup.	Add a confirmation popup when the logout button is clicked to prevent accidental logouts.
Multiple toast messages are displayed simultaneously if a button is clicked multiple times.	Restrict multiple toast messages from being displayed simultaneously by disabling repeated clicks.
Error messages lack clarity and professionalism. Example: 'referral code is incorrect!' should be 'Invalid referral code. Please check and try again.'	Standardize error messages to be clear and professional. Example: Use 'Invalid referral code. Please check and try again.'
On the reset password page, the password match is not checked at the frontend level, causing unnecessary API calls.	Implement frontend validation on the reset password page to check for password match before making API calls.
Placeholder text for the referral code is sent in the payload of the register API along with unwanted parameters.	Ensure the referral code placeholder text and unwanted parameters are excluded from the register API payload.
API accepts any parameter in the request body; it should reject extra parameters.	Modify the API to validate and reject any extra parameters in the request body.
After logout, the token is not invalidated.	Invalidate the token immediately after logout to ensure secure session management. it is getting login again with the same token
